-i- FUNCTION: C1Q ASSOCIATES WITH THE PROENZYMES C1R AND C1S TO YIELD C1, THE FIRST COMPONENT OF THE SERUM COMPLEMENT SYSTEM. THE COLLAGEN-LIKE REGIONS OF C1Q INTERACT WITH THE CA(2+)-DEPENDENT C1R(2)C1S(2) PROENZYME COMPLEX, AND EFFICIENT ACTIVATION OF C1 TAKES PLACE ON INTERACTION OF THE GLOBULAR HEADS OF C1Q WITH THE FC REGIONS OF IGG OR IGM ANTIBODY PRESENT IN IMMUNE COMPLEXES.
-i- SUBUNIT: C1 IS A CALCIUM-DEPENDENT TRIMOLECULAR COMPLEX OF C1Q, R AND S IN THE MOLAR RATION OF 1:2:2. C1Q SUBCOMPONENT IS COMPOSED OF NINE SUBUNITS, SIX OF WHICH ARE DISULFIDE-LINKED DIMERS OF THE AND B CHAINS, AND THREE OF WHICH ARE DISULFIDE-LINKED DIMERS OF THE AND B CHAINS, AND THREE OF WHICH ARE DISULFIDE-LINKED DIMERS OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Reid K.B.M., Bentley D.R., Wood K.J.; "Cloning and characterization of the complementary DNA for the chain of normal human serum Clq.";

Decreased adiponectin plasma levels are associated with obstity insulin resistance, and diabetes type 2. PHARMACEUTICAL: Adiponectin might be used in the treatment of diabetes type 2 and insulin resistance. SIMILARITY: Contains 1 collagenous domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EXPRESSION OF ENDOTHELIAL ADHESION MOLECULES. INVOLVED IN THE CONTROL OF FAT METABOLISM AND INSULIN SENSITIVITY.
SUBUNIT: HOMOOLIGOMER (POTENTIAL).
SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Synthesized exclusively by adipocytes and secreted into plasma.
DISEASE: Defects in APM1 are the cause of adiponectin deficier

"The cloning and sequencing of alpha 1(VIII) collagen cDNAs
"The cloning and sequencing of alpha 1(VIII) collagen cDNAs
demonstrate that type VIII collagen is a short chain collagen and
contains triple-helical and carboxyl-terminal non-triple-helical
domains similar to those of type X collagen.";
J. Biol. Chem. 264:16022-16039 (1999).
-!- FUNCTION: TYPE X COLLAGEN IS A PRODUCT OF HYPERTHROPHIC
CHONDROTOCYTES AND HAS BEEN LOCALIZED TO PRESUMPTIVE
MINERALIZATION ZONES OF HYALINE CARTILAGE.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
